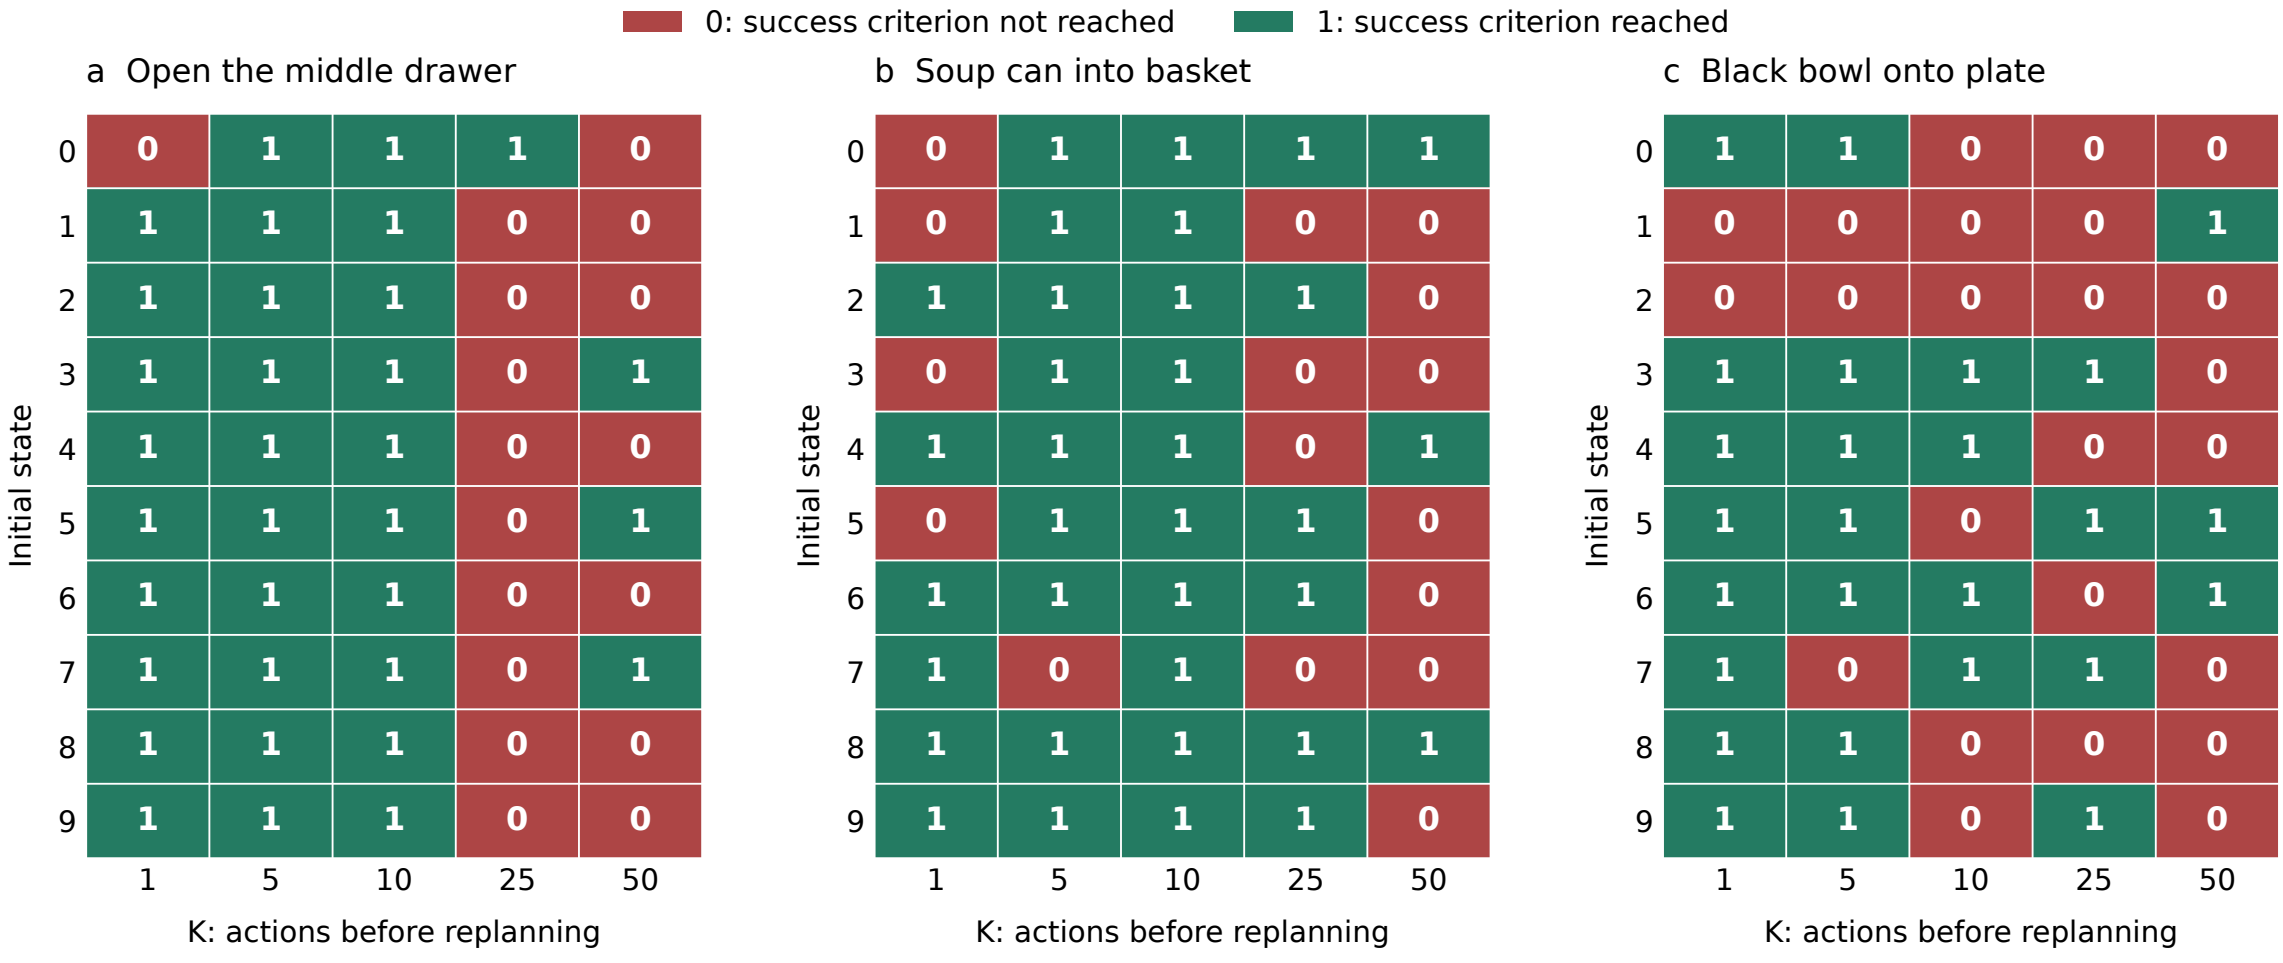
Native LIBERO outcomes for every matched initial state

150 unique episodes | one model | policy seed 11 | the same state across K



Each cell is one episode, not a success probability. All 150 episodes contribute to the main analysis.

Each task and K uses 10 matched initial states; each K has 30 episodes across the three tasks.

LIBERO success may precede object release. This figure shows outcomes, not manually inferred grasp errors.
